EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with George B. F. Yee on March 27, 2006.

The application has been amended as follows:

Claim 76 (currently amended) In a system for providing multiple access over a single communication channel, a receiver comprising:

a digital signal representing a received data burst;

a data bus, the digital signal being fed to the data bus;

a control bus;

a preamble detection component coupled to the control bus, the digital signal further being fed to the preamble detection component, the preamble detection component configured to detect preambles using a first spreading code;

plural demodulation circuits, each coupled to the data bus and to the control bus, each configured to produce a data stream from data received over the data bus;

a selection component operatively coupled to the preamble detection component and coupled to the control bus, the selection component configured to select an available demodulation circuit; and

Art Unit: 2634

plural additional preamble detection components, each configured to detect preambles using a spreading code different from the spreading code of the other preamble detection components, each coupled to receive the digital signal, each coupled to the data bus, each coupled to the selection component,

wherein one of the demodulation circuits operates on data in response to control signals issued by the preamble detection component and by the selection component, so that multiple data bursts received by the preamble detection component can be concurrently processed by selected ones of the demodulation circuits.

EXAMINER'S STATEMENTS OF REASONS FOR ALLOWANCE

2. Claims 76, 78, and 79 are allowable over prior art references because related references do not disclose multiple preamble detection components which detect preambles of different spreading codes and are coupled to a selection component which selects an available demodulation circuit based on control signals from a preamble detection component.
